

Using Docker

Known issues

With Docker on Windows there is *sometimes* an issue when closing down Docker because the files that you created are not saved and/or you cannot see any of the files on your *main* system. If this happens to you, the please try replacing this part of the Docker command (detailed elsewhere):

```
-v "$WORK_DIR":/home/jovyan/work
```

with:

```
--mount type=bind,source="$(pwd)",target=/home/jovyan/work
```

This should enable you to see any existing files that you have, while also being able to save any files that you create in JupyterLab.
