Base Utilities

In order to access the majority of the features that this module uses, you will need to install several 'base' utilities:

MacOS

You will need to install the following:

1. The Xcode Command Line Tools, which can usually be installed directly from the Terminal. If that does not work for you, then you can use the Apple Developer website to download and install manually. *Note*: this may require you to get a free developer account.
2. Although not strictly necessary, you'll *eventually* want the Homebrew package manager, which can also be installed directly from the Terminal.

Windows

You will need to install the following:

1. WSL 2, for which you can follow these instructions.
